

Being an engineer, I always have a natural affinity towards logical thinking and. I was always a guy who is more interested in the process rather than the end result, I mean my first process is to get the process right and i tend to ask a lot of questions. This triggered me in guessing what happens next. Before coining the term "Data Science". from childhood onwards, I always wanted to guess what's going to happen in future. in fact, I never knew back then what I was doing is actually data science. I am the biggest fan of investigation thriller movies that keeps my mind on my toes during the duration. closing on this. Decision making based on logic and given data-keeping stakeholders in mind is one thing I can do and prove my mettle in it. As I have mentioned above Data science is a field where you need to ask the right question to the right person. for example, if I want to do analytics in the marketing field I need to keep all the stake holders in mind, finding out who is going to be the potential competitor and how to get a major stake in MarketShare will be my primary focus as a marketing analyst/ Data scientist. I do firmly believe the responsibilities that are given to a data scientist out in the market is tailor-made for my

alignment of thoughts. That's the reason do firmly believe that I can make a long career in this field. I always wanted to take up my career in data/decision science. But, unfortunately, the organization I have worked with didn't give me enough freedom to do what I like. and the work I am doing is not related to analytics. being in the early stage of my career I believe that I should get a career transition as soon as possible. So why Edyoda? obviously as per my enquiry with the peers over linked in and going through the course structure over the website I was really fascinated by the kind of companies that I will be getting into. and I have gone to the profiles of the company for the offering role at Edyoda, then I felt yes this is the kind of work I wanted to do. and that too I can get a chance getting placed into some pure-play analytics firms all these factors made me apply for Edyoda.
